November 2017

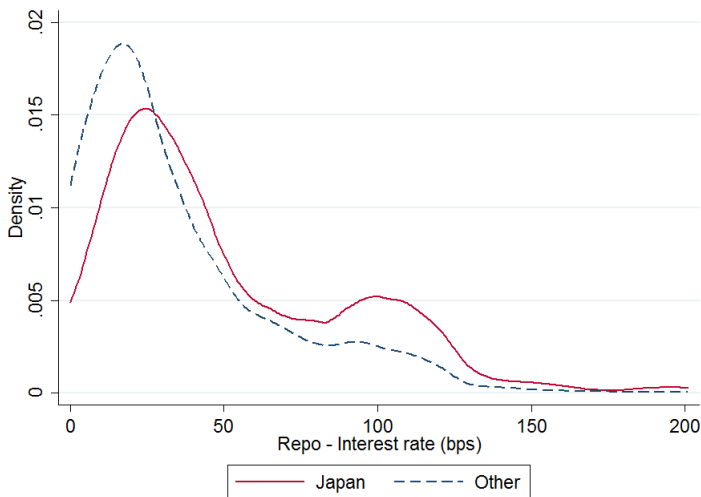

European Central Bank workshop

Disclaimer: views are our own and not necessarily those of the BIS.

Frictions in money markets

- ▶ There is a “Japan Repo Premium” in US money markets.
 - ▶ JP banks pay more for repos with the *same* risk with US MMFs.

Figure 1: (Smoothed) Unconditional Distribution of Repo Rates with MMFs

Business models of global banks

- ▶ All global banks are matched book repo intermediaries, except JP.
- ▶ ~ 10% JP repos are with MMFs, while 50-60% for FR and CA.
- ▶ Repo intermediation: MMF → non-JP → JP?

Sources: US FFIEC 002 Reports, authors' calculations.

This paper in a nutshell

- ▶ Japanese banks are different from other non-US banks:
 - ▶ JP long-term dollar loans dwarfs other non-US, since euro crisis.
 - ▶ Hence, they have large longer maturity dollar funding needs.
- ▶ Differences in business models & frictions in money markets:
 - ▶ Affect the *price of dollar funding* → JRP
 - ▶ Shape *dollar funding networks*
- ▶ *Price of dollar funding*:
 - ▶ Relationship frictions in repo → bargaining power affects pricing.
 - ▶ JP banks concentrate repos to few MMFs → ↓ Bargaining power
 - ▶ This helps explain the Japan Repo Premium.
- ▶ *Dollar funding networks*:
 - ▶ MMFs provide longer maturity repos to older clients.
 - ▶ Repo intermediation by maturity transformation by non-JP banks.
 - ▶ Economically significant spreads from doing so (~ 17 bps).
 - ▶ Disruptions in repo markets spill over to the FX swap markets.

Columns (1)-(3) restrict the instrument to ABCP/CP/CD (i.e. non-repos). Column (4) considers the entire market (i.e. repos and non-repos) and interacts the JP dummy with a dummy for repo contracts; instrument fixed effects in this regression control separately for ABCP, CP, CD, and the three different types of collateral within repo contracts (Treasury, Government Agency and Other). Column (5) considers only Non-Prime funds (i.e. funds that only do repos). Standard errors double-clustered at the bank-fund and time level in parentheses. ***, **, * denote significance at the 1, 5 and 10% level respectively. Repo is absorbed in the instrument FE.

By country

CDS Spreads

Time Series

Business models of global banks - Facts

- ▶ JP long-term dollar loans dwarf other non-US, since euro crisis.
Both globally and in the US
- ▶ The maturity profile of MMF liabilities of JP banks is longer.

Figure 2: (Smoothed) Maturities: Repo versus non-repo

Business models of global banks - Facts

- ▶ JP banks are net dollar suppliers to HQ, EU net receivers from HQ. Interoffice positions
- ▶ All global banks are matched-book repo intermediaries, except JP. Both globally and in the US
- ▶ Majority of JP repos not from MMFs, opposite for others.

Hypothesis 1: Relationships matter in pricing of repos.

- ▶ 1.a. Relationships with *funds* matter in pricing of repos.
 - ▶ The more “important” a *fund* is for a bank, the higher is the price.
 - ▶ The more “important” a bank is for a *fund*, the lower is the price.
- ▶ 1.b. Relationships with *fund families* matter in pricing of repos.
 - ▶ The more “important” a *fund family* is for a bank, the higher is the price.
 - ▶ The more “important” a bank is for a *fund family*, the lower is the price.

Measuring relationships

- ▶ How important is a fund (or family $BV_t^{\{b,ff\},m}$) for a bank, in a given market m ($m \in \{repo, non - repo\}$) and date t ?

$$BV_t^{\{b,f\},m} = \frac{\sum_{b,f} Value_t^m}{\sum_{f=1}^{F_b} Value_t^{\{b\},m}} \quad (1)$$

- ▶ $\uparrow BV_t^{\{b,f\},m}$ (or $BV_t^{\{b,ff\},m}$) \Rightarrow \uparrow fund bargaining power
- ▶ How important is a bank for a fund (family, $FV_t^{\{b,ff\},m}$), in a given market m ($m \in \{repo, non - repo\}$) and date t ?

$$FV_t^{\{b,f\},m} = \frac{\sum_{f,b} Value_t^m}{\sum_{b=1}^{B_f} Value_t^{\{f\},m}} \quad (2)$$

- ▶ $\uparrow FV_t^{\{b,f\},m}$ (or $FV_t^{\{b,ff\},m}$) \Rightarrow \downarrow fund bargaining power

Summary statistics of relationships

Japanese banks' repos are concentrated within a few fund families.

Table 1: Average shares of funds ($BV_t^{\{b,f\},m}$) and families ($BV_t^{\{b,ff\},m}$) for banks, by instrument and country

	$BV_t^{\{b,ff\},m}$		$BV_t^{\{b,f\},m}$	
	Repo	Non-repo	Repos	Non-repo
Japan	40.2	10.9	7.9	2.8
Rest	14.3	10.6	2.9	3.5

Table 2: Average shares of banks for funds ($FV_t^{\{b,f\},m}$) and fund families ($FV_t^{\{b,ff\},m}$), by instrument and country

	$FV_t^{\{b,ff\},m}$		$FV_t^{\{b,f\},m}$	
	Repo	Non-repo	Repos	Non-repo
Japan	5.8	7.0	12.3	7.3
Rest	10.6	5.6	14.1	6.0

Relationship with fund family explains repo pricing

	Fund (1.a.)	Fund Family (1.b)
	Repo rate	Repo rate
JP	2.866*** (1.046)	1.502 (1.098)
$BV_{t-1}^{\{b,f\},repo}$	0.0118 (0.0195)	
$FV_{t-1}^{\{b,f\},repo}$	-0.00221 (0.0123)	
$BV_{t-1}^{\{b,ff\},repo}$		0.0521*** (0.0123)
$FV_{t-1}^{\{b,ff\},repo}$		-0.0448*** (0.0114)

Inelastic long-maturity US dollar demand of JP banks

Hypothesis 3: Given the long-term US dollar exposure of Japanese banks on the asset side, they have a relatively inelastic demand for longer-maturity US dollar funding.

- ▶ 3.1. The Japan Repo Premium is larger for longer maturity repos.
- ▶ 3.2. Since non-repo markets are longer-term US dollar funding markets, the US MMF reform was a negative supply shock. As a result, in the non-repo market, the prices Japanese banks pay rose more than others.

Hypothesis 3.1. JRP is larger for longer maturities.

	Repo rate
JP	-0.332 (1.128)

Standard errors double-clustered at the bank-fund and time level in parentheses. ***, **, * denote significance at the 1, 5 and 10% level respectively. Controls include Log(value), 5Y CDS, Rem. maturity. JP and post_reform are absorbed in bank and date FE, respectively. Post-reform is a dummy variable that is equal to 1 after October 2016.

US dollar intermediation - puzzles remain

Sources: US FFIEC 002 Reports, authors' calculations.

- ▶ Why do Japanese banks not do repos with MMFs?
 - ▶ Why not divide existing repos to more funds?
 - ▶ Why not bring the repos currently not with MMFs into this market?
- ▶ Is there room for intermediation where other banks provide terms that MMFs are unable/unwilling to provide?

Why do JP banks not diversify existing repos with MMFs?

Hypothesis 4: Building relationships is costly. In particular, funds provide longer maturity repos to long-term clients.

	Rem. maturity
ReIn length	0.0260 (0.0163)

Standard errors double-clustered at the bank-fund and time level in parentheses. ***, **, * denote significance at the 1, 5 and 10% level respectively. JP is absorbed in date*bank FE.

How much would other banks make by repo intermediation?

If a non-JP bank borrows ON, lends to a JP bank at 30 days, charging the MMF price

This is an arbitrage for European banks since their leverage ratio calculation is only at quarter ends. Alternative to Fed funds arbitrage which earns around 8 bps.

	Repo rate

Conclusion

- ▶ Frictions in money markets:
 - ▶ Identity of the borrower/relationships/bargaining matters in pricing in money markets.
- ▶ Business models of global banks have diverged since 2011:
 - ▶ JP banks continue to have inelastic long-term dollar demand.
 - ▶ Euro banks changed from loans to repo int. and FFR arbitrage.
- ▶ The combination of frictions + diverging models:
 - ▶ Affect the *price of dollar funding*
 - ▶ Shape *dollar funding networks*
- ▶ Repo + Unsecured + FX swap markets are interconnected.
- ▶ Policy implications for emerging post-crisis fault lines.
